What is DocBook ?

DocBook is an SGML dialect developed by O'Reilly and HaL Computer Systems in 1991. It is currently maintained by the Organization for the Advancement of Structured Information Standards (OASIS). DocBook describes the content of articles, books, technical manuals, and other documents. Although DocBook is focused on technical writing styles, it is general enough to describe most prose writing. In this article, I'll discuss an XML variant of the DocBook DTD that is also available.
